

Hi Kumar Gautam, please find below the interview brief for your reference:

Round 1 — Screening Round · Candidate Brief

Welcome, and thanks for your interest in the Software Engineering Intern role!

Here's what to expect in your first round so you can prepare.

What this round is

A 30-45-minute conversation with one of our engineers. There's no live coding and no algorithm puzzles. Instead, we'll talk about a project you've actually built.

What to prepare

- Pick one project from your resume or GitHub that you know well and are proud of. It can be small — what matters is that you built it and understand it deeply.
- Personal projects, course projects, hackathon builds, or open-source contributions are all fine.
- If it was a team project, be ready to clearly explain which parts you personally did.
- Have the code open and be ready to share your screen / walk through the repo.
- Be ready to talk about:
 - What the project does and why you built it.
 - How it's structured — the main components and how they fit together.
 - Why you made the choices you did (language, framework, database, architecture) and what alternatives you considered.
 - What you'd improve or do differently, and how it might behave at scale.

How to do well

- Understand over impress. We'd much rather hear a small project explained with real depth than a big one you can't dig into.
- "I don't know" is a fine answer — followed by how you'd reason about it.

- It's great to mention trade-offs, things that broke, and what you learned.

Prerequisites / logistics

- A laptop with your project code accessible.
- A stable internet connection and a working mic/camera (if remote).
- The repo or a way to show the code (screen share, or it's public on GitHub).

What we're evaluating

Depth of understanding, design judgment, grasp of fundamentals, clear communication, and genuine curiosity about your own work.

Relax — this is meant to be a technical conversation between engineers, not an interrogation. We're excited to see what you've built.

Regards,

Rapyuta Robotics Recruitment Team
